## Heuristic Evaluation

Nº	Problem	Heuristic	Description	Severity	Solution	Screenshot
1	Website crashes if you click to view a created recipe	Error prevention	After creating a new recipe, if you don't insert the cooking steps the website crashes.	Major, in relation to the prototype, but could be Critical.	As with the other information about the recipe you could maybe prevent users from submitting the recipe without inserting the cooking steps.	
2	No feedback after submitting our opinion (after trying a recipe)	Visibility of system status	Even though user must click "Confirm" to give their opinion, nothing happens after that that shows that their evaluation has actually been submitted.	Minor	We believe it could be helpful for the user to see some feedback confirming that his opinion has been submitted. A notification for example, like the ones when you add a recipe to your favorites.	
3	Can't give evaluate recipe without going through it	Flexibility and Efficiency of use	To evaluate a recipe, the user must go through the steps by pressing the "Exprimente esta receita agora" button. This might not be needed to cook the dish seeing as the steps or listed besides the image.	Minor	Create a rate button below the steps listed that makes the evaluation only pop up.	

Nº	Problem	Heuristic	Description	Severity	Solution	Screenshot
4	No way of editing an ingredient or it's quantity without removal	Flexibility & Efficiency of Use	While creating a recipe after inserting an ingredient with a determined quantity, the user can not edit it. The user can only remove the ingredient and insert it again.	Minor	Add an edit button besides every new ingredient line or allow the text itself to be edited.	

We received Foodie for evaluation on November 23 and delivered our report on November 30. Overall, we enjoyed the concept of this app and its interface. The logo really suits the app. If we strictly follow the test cases the results are the ones expected from the prototype.
